

Week 4 Progress Report

Intern Name: Khadija Ayub

Project: Employee Management System Dashboard

Week: Week 4

Objective

Improve the Employee Management Dashboard by introducing reusable React components, enhancing UI consistency and accessibility, adding department and attendance interfaces, implementing dark mode, and improving the overall frontend structure and user experience.

Tasks Completed

- Created reusable common components including Button, FormField, Select, RadioGroup, and SearchInput.
- Refactored the employee form to use reusable form components instead of repeated JSX.
- Enhanced FormField to support both standard inputs and textareas through configurable props.
- Added reusable Select and RadioGroup components for department and gender fields.
- Updated the Button component to support variants, sizes, icons, disabled state, and custom classes.
- Refactored the employee table to use reusable Button and SearchInput components.
- Improved sortable table headers by using accessible button elements and reusable sort icons.
- Added accessible labels and ARIA attributes to form fields, validation messages, sorting controls, and icon-only action buttons.
- Implemented the Departments page with department statistics, department table, manager information, employee counts, and active/inactive status badges.
- Implemented department add/edit functionality using a reusable modal and form structure.
- Added department delete actions and dynamic department statistics.
- Implemented the Attendance page with attendance statistics, employee attendance information, and status indicators.
- Added light and dark themes using CSS variables and a data-theme attribute.
- Improved responsive layouts for forms, tables, navigation, department management, and attendance sections.
- Organized styles and common components to make the project easier to maintain and extend.

React Concepts Practiced

Reusable Components, Component Composition, Props, Controlled Components, useState, useEffect, Conditional Rendering, Dynamic Rendering with map(), State Management, Modal State Management, Callback Props, Component Reusability, Accessibility Attributes, and React Icons.

JavaScript Concepts Practiced

map(), reduce(), spread operator, arrow functions, object destructuring, conditional expressions, array state updates, object state updates, and dynamic rendering.

Challenges Faced

- Identifying repeated JSX patterns and converting them into reusable components without changing existing functionality.
- Designing reusable components flexible enough to support different input types, textarea fields, dropdowns, and radio groups.
- Managing edit and add states within the same department modal.
- Keeping department statistics synchronized with the department state after edits and additions.

- Applying dark mode consistently across pages that originally used hardcoded colors.
- Maintaining accessibility while converting clickable table headers and icon buttons into reusable UI controls.
- Keeping the new pages visually consistent with the existing dashboard design.

Outcome

Successfully transformed the project into a more structured and reusable React application. Common UI elements are now shared across pages, the Departments and Attendance pages have been implemented, dark mode and accessibility improvements have been added, and the overall frontend has become more consistent, responsive, maintainable, and user-friendly.
